

Formative mini test

AQA A Level Sociology 7192 • L017 • v1.0 • 15 marks • 15 minutes

CONNECT & CHECK | SHARE | PRESENT | APPLY | RECALL & REVIEW

Complete without notes after the lesson or for independent consolidation. This original classroom test is separate from the six-item workbook retrieval quiz.

1 Distinguish descriptive and normative normality. [2]

2 Explain the change from 66.6% to 65.3%. [3]

3 Name Chester's dual-earner continuity concept. [1]

Evidence and application

Fictional interpretation panel using real ONS estimates: Analyst A says the 65.3% married-couple share of UK families in 2025 proves nothing has changed. Analyst B says its fall from 66.6% in 2015 proves marriage has disappeared. Analyst C says the 29.5% one-person share of all households proves those people have no family ties. Analyst D asks for life histories and attitude evidence alongside the counts. Only the quoted ONS figures are observed estimates; the speakers are invented.

4 Correct two of analysts A, B and C. [4]

5 Why do the two 2025 percentages use different denominators? [2]

6 Give a qualified answer about whether diversity is normal. [3]

After marking

Score ____ / 15. Correct your least secure idea and explain it again tomorrow. This diagnostic score is not a predicted grade.
